

When your teeth are darker than desired, laser tooth whitening is a fast and effective way to whiten teeth.

A shade guide is used to record your tooth color before whitening begins.

The first step is to apply a gingival dam to your gums to protect them during the laser whitening session.

Whitening solution is then carefully applied to the teeth that will be whitened. Your dentist will then use a specialized laser to begin whitening the teeth.

After the laser session is completed, your mouth and teeth are thoroughly cleaned and your teeth are noticeably whiter. Your dentist will recommend an interval for you to return for additional whitening sessions.
